From Newtonian to

Metric-affine Gravity

Recent developments and experiments

Universität Bielefeld
Theoretische Physik E5

S³ Seminar, Lindau 18.2.2004
Overview

- Basics of Newtonian gravity
- General relativity: Field equations & first modifications
- The gauge principle
- Metric-affine (gauge) theory of gravity
- Torsion + gravitational birefringence
- New tests using magnetic white dwarfs
Newtonian gravitation

1687: "Philosophia naturalis principia mathematica"

Important step towards an unification of Physics: Galilei + Kepler

\[ m_i \frac{d^2 \vec{r}_i}{dt^2} = -G \sum_{j=1, j \neq i}^{N} \frac{m_i m_j (\vec{r}_i - \vec{r}_j)}{|\vec{r}_i - \vec{r}_j|^3} \]  \hspace{1cm} (1)

\[ G = (6.6726 \pm 0.0005) \times 10^{-11} \frac{m^3}{kg^2 s^2} \] \hspace{1cm} Gravitational Constant

\[ \phi(\vec{r}) = -G \sum_j \frac{m_j}{|\vec{r} - \vec{r}_j|} = -G \int d^3 \vec{r}' \frac{\phi(\vec{r}')}{|\vec{r} - \vec{r}'|} \]  \hspace{1cm} (2)

\[ \Rightarrow m_i \frac{d^2 \vec{r}_i}{dt^2} = -m_0 \nabla \phi(\vec{r}) \] \hspace{1cm} (3) Equation of motion

\[ \Rightarrow \Delta \phi(\vec{r}) = 4\pi G \rho(\vec{r}) \] \hspace{1cm} Field equation in Newtonian gravitation

Basic problem: Action at a distance theory!
Analogous: Electrostatic Field equation

\[ \Delta \phi_e = -4\pi \sigma_e \]

electrostatic potential \hspace{1cm} charge density

Electrostatic \hspace{1cm} \rightarrow \hspace{1cm} Electrodynamics

\[ \Delta \rightarrow \Box = \frac{1}{c^2} \frac{\partial^2}{\partial x^2} - \Delta \]

i.e. variations propagate with a finite speed c!

\[ \sigma_e \rightarrow (\sigma_e \mathbf{c}, \sigma_e \mathbf{v}^i) = (j^x) \]

\[ \phi_e \rightarrow (\phi_e, A^i) = (A^x) \]

\[ \Rightarrow \Delta \phi_e = -4\pi \sigma_e \rightarrow \Box A^x = \frac{4\pi}{c} j^x \quad \text{Maxwell equations} \]

Back to gravity:

\[ \Delta \phi = 4\pi G \sigma \rightarrow \Box g^{\mu\nu} \propto G T^{\mu\nu} \]
General relativity

\[ \square g^{\alpha \beta} = - \frac{8\pi G}{c^4} T^{\alpha \beta} \]

Require:

1. \( T^{\alpha \beta} \) is a Riemann Tensor
2. \( T^{\alpha \beta} \) contains only first+second derivatives of \( g^{\alpha \beta} \) (KISS)
3. \( T^{\alpha \beta} = T^{\beta \alpha} \)
4. Newtonian limit for weak fields

\[ \Rightarrow \quad R_{\mu \nu} - \frac{1}{2} R g_{\mu \nu} = - \frac{8\pi G}{c^4} T_{\mu \nu} \]

Field equation of General relativity

\[ R_{\mu \nu} = R^\kappa_{\mu \kappa \nu} = g^{\mu \kappa} R_{\kappa \nu} \]  
,  
\[ R = R^\kappa_{\kappa} = g^{\mu \nu} R_{\mu \nu} \]

\[ R^\kappa_{\mu \nu \lambda} = \frac{1}{2} \left( \frac{\partial^2 g_{\kappa \nu}}{\partial x^\lambda \partial x^\mu} + \frac{\partial^2 g_{\mu \nu}}{\partial x^\lambda \partial x^\kappa} - \frac{\partial^2 g_{\mu \kappa}}{\partial x^\lambda \partial x^\nu} - \frac{\partial^2 g_{\kappa \nu}}{\partial x^\lambda \partial x^\mu} \right) \]

\[ + \frac{1}{2} g_{\mu \nu} \left( \Gamma^\alpha_{\lambda \kappa} \Gamma^{\beta}_{\mu \nu} - \Gamma^\alpha_{\mu \kappa} \Gamma^{\beta}_{\nu \lambda} \right) \]

Curvature tensor

\[ \left[ \Gamma^\kappa_{\lambda \mu} = \frac{1}{2} g^{\kappa \nu} \left( \frac{\partial g_{\mu \nu}}{\partial x^\lambda} + \frac{\partial g_{\lambda \nu}}{\partial x^\mu} - \frac{\partial g_{\lambda \mu}}{\partial x^\nu} \right) \right] \]
Are these field equations unique?

Fixed by requirements (1) - (4), but...

We can drop (2) and allow for terms, linear in $g_{\mu\nu}$

$$ R_{\mu\nu} - \frac{1}{2} R g_{\mu\nu} + \Lambda g_{\mu\nu} = - \frac{8\pi G}{c^4} T_{\mu\nu} $$

Newtonian limit:  
$$ \Delta \phi = 4\pi G S - \frac{1}{2} c^2 \Lambda $$
$$ = 4\pi G \left( S - S_{\text{vac}} \right) $$

$$ S_{\text{vac}} = \frac{c^2}{8\pi G} \Lambda \text{ Vacuum Energy density} $$

$\Lambda$ has to be small to be in agreement with Newton within the Solar system

$$ \frac{\Lambda}{\sqrt{\Delta}} \gg \text{diameter of Solar system} $$

e.g. $\Lambda^{-\frac{1}{2}} \approx 10^3 L_j$ $\Rightarrow$ not relevant within Solar system $\ll 1 M_{\odot}$ or Galaxy $\approx 10^5 L_j$

but important on cosmological scale

$\Lambda$: Cosmological constant
Basic criteria for the viability of a gravitation theory

1. It must be complete
   Kinematical relativity (Milne, 1938): makes no gravitational red-shift prediction

2. It must be selfconsistent:
   (Predictions for the outcome of every experiment must be unique)
   Various theories by Withrow & Morduch (1965)
   Different results for light propagation for light viewed as particles and light viewed as waves.

3. It must be relativistic
   (Reduce to Special Relativity as gravity is "turned off")
   Newtonian gravitation theory
4 classical tests support General Relativity (at least)

- Light deflection (1919)
- Perihelion shift of Mercury
- Gravitational red-shift (test of the EEP)
- Radar echo delay

... so far everything is fine, but ...

... General Relativity is a purely classical theory!

Where do we have to modify GR without experimental hints?

→ The gauge principle
The gauge principle

System described by $\psi(x)$ (e.g., electron wavefunction) actually "observable": $|\psi(x)|^2$ probabilistic interpretation

Simplest example: $U(1)$-symmetry

The Dirac-Field

$$\mathcal{L}_0 = \bar{\psi} \left[ i \gamma^\mu \partial_\mu - m \right] \psi$$

now:

$$\psi(x) \rightarrow \psi'(x) = e^{-i \alpha(x)} \psi(x)$$
$$\bar{\psi}(x) \rightarrow \bar{\psi}'(x) = e^{+i \alpha(x)} \bar{\psi}(x)$$

clear: $|\psi'(x)|^2 = |e^{-i \alpha(x)}|^2 |\psi(x)|^2 = |\psi(x)|^2$

$\Rightarrow \mathcal{L}_0$ has to be valid also for $\psi'(x)$, but...

$$\partial_\mu \psi(x) \rightarrow (\partial_\mu \psi)'(x) = e^{-i \alpha(x)} \left( \partial_\mu \psi(x) \right) - \left( i \partial_\mu \alpha(x) \right) e^{-i \alpha(x)} \psi(x)$$

additional term

Asymmetry!

$\Rightarrow \delta\mathcal{L}_0 = \bar{\psi} \gamma^\mu \psi \left( \partial_\mu \alpha \right)$

(1) is not invariant under the transformation (2)
Solution: Introducing a new gauge field $A_\mu$

Define covariant derivative: $D_\mu \psi(x) = (\partial_\mu - i e A_\mu(x)) \psi(x)$

With $A_\mu \Rightarrow A'_\mu = A_\mu + \partial_\mu \lambda$; $\lambda = -\frac{i}{2} \chi(x)$

$\Rightarrow (D_\mu \psi(x))' = (\partial_\mu - i e A'_\mu(x)) \psi'(x)$

$= i \left( \partial_\mu \psi(x) e^{-i \chi(x)} \psi(x) + e^{-i \chi(x)} \partial_\mu \psi(x) \right)$

$- i \left( e A'_\mu(x) + \partial_\mu \chi(x) \right) e^{-i \chi(x)} \psi(x)$

$= e^{-i \chi(x)} \left( \partial_\mu - i e A_\mu(x) \right) \psi(x)$

$= e^{-i \chi(x)} D_\mu \psi(x)$

No asymmetry!

Note: $A_\mu$ is massless since $\frac{1}{2} m A_\mu A_\mu$ is not invariant

$\Rightarrow$ Photon field

$\mathcal{L} = \mathcal{L}_0 + \mathcal{L}_{\text{int}}, \mathcal{L}_{\text{int}} = -\frac{1}{2} \gamma^\mu A_\mu$ invariant

Invariance of the Lagrangian under local symmetry transformations requires the existence of additional gauge fields!
The gauge principle is the cornerstone of the Standard model

\[ SU(3) \times SU(2) \times U(1) \]

\[ \text{Strong Interaction} \quad \text{Electroweak Interaction} \]

What about Gravity?

Neyl (1929)

Utigama, Sciama & Kibble (1961):

General relativity as a gauge theory of the Poincaré-group

\[ \vec{x} \rightarrow \vec{x}' = \Lambda \vec{x} + \alpha \]

\[ \Lambda \text{ Lorentz transformation} \]

Currently most promising: Metric-affine gauge theory of gravity

(Hehl et al. 1994)

\[ \xi \rightarrow \xi' = \Lambda \xi + \zeta \]

\[ \xi, \zeta \in \mathbb{R}^n, \quad \Lambda \in GL(n, \mathbb{R}) \]

General linear group

New gravitational gauge fields:

- Torsion: Influence of the spin on the structure of space-time
- Nonmetricity: Deformation of length and angle standards during parallel transport
Problem:
Currently no experimental evidence for the existence of Torsion!
Rest of the talk is therefore devoted to the following questions:

1. How does Torsion possibly interact with the electromagnetic field?
2. What are the theoretical and experimental consequences?
3. Where (and how) do we have to observe?

Ansatz:
$$\mathcal{L} = \mathcal{L}_0 + (T_{\mu \nu} \wedge F)^\gamma_{\nu} \wedge F$$  
(Solanki, Preuss, Haugan 2003)

- Conservation of electric charge
- So far unique in metric-affine gravity
- Predicts gravitational-birefringence
  (violates the EEP)

\[ C_\perp > C_\parallel \]
\[ \Rightarrow \text{gravity-induced birefringence} \]

\[ \theta \]
\[ \mu = \cos \theta \]

Observer
Observable effects of gravity-induced birefringence

Phase shift between orthogonal polarization components

\[ \Delta \phi_{\text{MAG}} (\mu) = \sqrt{\frac{2}{3}} \frac{L^2 \frac{2\pi M_*}{\lambda R^3}}{\mu + 1} \] \( (\mu + 2)(\mu - 1) \)

- What is our objective?
  - Setting strong limits on \( \mathcal{L}^2 \) and decide about the physical relevance of this approach.

- What are we looking for?
  - Depolarization effects

- Where do we observe?
  - Massive objects with strong gravitational and magnetic fields

\[ \Rightarrow \text{Magnetic white dwarfs} \]
Magnetic white dwarfs (MWDs)

**Basics:**
- approx. 65 white dwarfs are classified as MWD (≈ 5% of all)
- Field strength $3 \times 10^4 \text{ G} \sim 10^5 \text{ G}$
- Dipolar (and often decentered) fields
- Circular polarization up to $\sim 20\%$ (!) (RE J0317-853)

**IDEA**

\[
\text{MAG} \downarrow \downarrow \downarrow \downarrow \downarrow
\]

\[
\kappa^2 \neq 0
\]

\[
\downarrow \downarrow \downarrow \downarrow \downarrow
\text{different } \Delta \Phi \text{ from all parts of extended source}
\]

\[
\downarrow \downarrow \downarrow \downarrow \downarrow
\text{depolarization of combined polarization from extended source}
\]

Observation of polarization from extended source $\neq 0$

LIMIT on $\kappa^2$
REJ0347-853

- Discovered in 1995 during ROSAT all-sky survey
- Very remarkable object:
  \( P_{\text{rot}} = 725 \ \text{sec} \)
  \( M_* = 1.35 \ M_\odot \)
  \( R_* = 0.0035 \ R_\odot \)
    \( = 0.38 \ R_{\text{Earth}} \)
  \( B = 1.4 \cdot 10^8 \ G \sim 7.3 \cdot 10^8 \ G \)
  \( V_{\text{max}} \approx 20\% ! \)
3.4. RE J0317-853

Figure 3.5: Successive rotational phases of RE J0317-853 in steps of 0.25\(\pi\), beginning with \(\phi = 0.25\pi\) (top left) to \(\phi = 2\pi\) (bottom right). The dashed line marks the stellar equator whereas the solid line shows the projection of the magnetic equator on the stellar surface. The cross marks the position of the rotation axis and the dot the position of the magnetic pole.

---

Longitudinal Magnetic Field Strength in MG

\[-726 \quad -363 \quad 0 \quad 363 \quad 726\]
Magnetic field distribution between 140 MG and 200 MG at phase with strong polarization

\[ \downarrow \]

Extreme assumption:
All field vectors point towards observer

\[ \downarrow \downarrow \]

Maximum possible polarization
26.5%

Observed: \(~17\%-20\%\)

\[ \downarrow \]

\[ \mathbf{h}^2 \leq (18 \text{ m})^2 \]

all magnetic fields \(< 530 \text{ MG}\)

\[ \downarrow \]

\[ \mathbf{h}^2 \leq (30.5 \text{ m})^2 \]

Compare:
Sun: \[ \mathbf{h}^2 \leq (1950 \text{ m})^2 \]
(Solanki, Preuss, Haggan 2003)

(16)
Summary

- General relativity is a valid but incomplete theory
- Gauge principle as a guiding-line
- Metric-affine gravity best alternative for GR
- Coupling between Torsion + Electromagnetism leads to gravitational birefringence
- Strong limits on the relevant coupling constant $l^2$ by using magnetic white dwarfs

To do

- Gravitational lensing + birefringence
- Torsion in the early universe
